

PHP Intro - Mentor session

You will have to create a webpage for selling products (**it's not responsive!**)

Each product will be consisted of an image (url to an image), name, description, price, discount percentage (0 to 100), shipping cost, rating, gender (male/female) and whether the product is in stock or not.

1. If the watch gender is male, the card body will have a background with color: **#f7f7f7**. Else if it is a female watch, the background will have the color: **#ffe6ee**;
2. If the product has a discount, the name will be in the following format: "ProductName DiscountPercentage% OFF!". For eg: "Watch 20% OFF!". Otherwise only the product name will be shown!
3. If the product is on a discount, the new price will be calculated on the base of the discount. Then the old price will be shown with gray letters and a line through, and the new discount price will be shown right next to it. Otherwise only the product price will be shown!
4. If the product is in stock, "In Stock" in green letters will be shown. Otherwise "Out Of Stock" in red letters will be shown!
5. At the end of the product card, the total price is calculated, taking the discount and the shipping price into account!
6. If the product is In Stock, there will be a green "Order" button. Otherwise there will be a red "N/A" button.

If you need to display a different HTML element depending on a condition, you can do that with PHP in the following way:

.... previous html code

`<?php if(condition) { ?>` ← open a bracket for the if statement

`<div> Condition passed</div>` ← IN IF STATEMENT

`<?php } else { ?>` ← closing the bracketed from the if statement, opening else statement

`<div> Condition did not pass </div>`

`<?php } ?>` ← closing the bracket from the else statement

.... rest of the html code
